MOTION #1: REQUIRED MATRIX-MATCHING PRIORITY FOR PTS

This motion would establish which current fields of testing need to have in-matrix PTs available. In-matrix PTs are critical to assess method performance for potency, pesticides and residual solvents. In-matrix PTs must be available for potency, pesticides, and residual solvents initially. These PTs will be followed sequentially by the less critical mycotoxins, terpenes, microbial analysis, metals, water activity, moisture, and then foreign matter.
